

### 11.5 #10

$$L_1: x = 1 - 2t_1, y = 14 + t_1, z = 5 - t_1$$

$$L_2: x = t_2, y = 4 + 3t_2, z = 3 + t_2$$

$L_1$  is parallel to  $\vec{v}_1 = \langle -2, 1, -1 \rangle$

$L_2$  is parallel to  $\vec{v}_2 = \langle 1, 3, 1 \rangle$

Now  $\vec{v}_1$  is not parallel to  $\vec{v}_2$  since  $\vec{v}_1$  is not a constant multiple of  $\vec{v}_2$ .

[You could also show  $\vec{v}_1 \times \vec{v}_2 \neq \vec{0}$ , so the vectors are not parallel.]

Thus  $L_1$  is not parallel to  $L_2$ .

Does  $L_1$  intersect  $L_2$ ?

If yes, we will find the point of intersection.

If no, the lines are skew.

$$\textcircled{1} \quad 1 - 2t_1 = t_2$$

$$\textcircled{2} \quad 14 + t_1 = 4 + 3t_2$$

$$\textcircled{3} \quad 5 - t_1 = 3 + t_2$$

$$\textcircled{2} + \textcircled{3} \Rightarrow 19 = 7 + 4t_2 \Rightarrow 12 = 4t_2 \Rightarrow t_2 = 3$$

$$\text{Plrg } t_2 = 3 \text{ into } \textcircled{2} \Rightarrow 14 + t_1 = 4 + 3(3) \\ t_1 = -1$$

Plrg  $t_1 = -1$  and  $t_2 = 3$  into  $\textcircled{1}$  and  
see if the equation is satisfied.

$$\text{LHS of } \textcircled{1}: 1 - 2t_1 = 1 - 2(-1) = 3$$

$$\text{RHS of } \textcircled{1}: t_2 = 3 \quad \leftarrow \uparrow \text{ same, so lines intersect}$$

Point of intersection:  $x = 3$   
 $y = 14 + t_1 = 13$   
 $z = 5 - t_1 = 6$   $(3, 13, 6)$
