

Chapter 3.3 Practice Problems

EXPECTED SKILLS:

- Know how to compute the derivatives of exponential functions.
- Be able to compute the derivatives of the inverse trigonometric functions, specifically, $\sin^{-1} x$, $\cos^{-1} x$, $\tan^{-1} x$ and $\sec^{-1} x$.
- Know how to apply logarithmic differentiation to compute the derivatives of functions of the form $(f(x))^{g(x)}$, where f and g are non-constant functions of x .

PRACTICE PROBLEMS:

For problems 1-16, differentiate. In some cases it may be better to use logarithmic differentiation.

1. $y = e^{6x}$

$$\boxed{6e^{6x}}$$

2. $g(x) = xe^{2x}$

$$\boxed{e^{2x} + 2xe^{2x}}$$

3. $f(x) = 5^{x^2}$

$$\boxed{2x \ln(5) 5^{x^2}}$$

4. $y = e^x \cos x$

$$\boxed{-e^x \sin x + e^x \cos x}$$

5. $g(x) = e^{x^2(x-1)}$

$$\boxed{e^{x^2(x-1)}(3x^2 - 2x)}$$

6. $f(x) = \frac{1 - e^{2x}}{1 - e^x}$

$$\boxed{e^x}$$

7. $f(x) = \frac{\ln x}{e^x + 3x}$

$$\boxed{\frac{e^x + 3x - x \ln(x)e^x - 3x \ln(x)}{x(e^x + 3x)^2}}$$

8. $f(x) = \ln(e^x + 5)$

$$\frac{e^x}{e^x + 5}$$

9. $y = x^{x^2}$

$$x^{x^2}(x + 2x \ln x)$$

10. $f(x) = e^{\cos^2 2x + \sin^2 2x}$

$$0$$

11. $h(x) = \exp\left(\frac{1}{1 - \ln x}\right)$

$$\frac{1}{x(1 - \ln x)^2} \exp\left(\frac{1}{1 - \ln x}\right)$$

12. $f(x) = (\ln x)^{e^x}$

$$(\ln x)^{e^x} \left(\frac{e^x}{x \ln x} + e^x \ln(\ln x) \right)$$

13. $y = \cos^{-1}(3x)$

$$-\frac{3}{\sqrt{1 - 9x^2}}$$

14. $y = \arcsin(x^2)$

$$\frac{2x}{\sqrt{1 - x^4}}$$

15. $y = \frac{\arctan(e^x)}{x^3}$

$$\frac{xe^x - 3 \tan^{-1}(e^x) - 3e^{2x} \tan^{-1}(e^x)}{x^4(1 + e^{2x})}$$

16. $y = x^{\cos x}$

$$x^{\cos x} \left(\frac{\cos x}{x} - \sin x \ln x \right)$$

17. Compute an equation of the line which is tangent to the graph of $y = e^{3x}$ at the point where $x = \ln 2$.

$$y - 8 = 24(x - \ln 2)$$

18. Compute an equation of the line which is tangent to the graph of $f(x) = \cos^{-1} x$ at the point where $x = \frac{1}{2}$.

$$y = -\frac{2}{\sqrt{3}}x + \frac{\pi + \sqrt{3}}{3}$$

19. Find all value(s) of x at which the tangent lines to the graph of $f(x) = \tan^{-1}(4x)$ are perpendicular to the line which passes through $(0, 1)$ and $(2, 0)$.

$$x = \pm \frac{1}{4}$$

20. Find a linear function $T_1(x) = mx + b$ which satisfies both of the following conditions:

- $T_1(x)$ has the same y -intercept as $f(x) = e^{2x}$.
- $T_1(x)$ has the same slope as $f(x) = e^{2x}$ at the y -intercept.

$$y = 2x + 1$$

21. Compute an equation of the line which is tangent to the curve $e^{xy^2} + y = x^4$ at $(-1, 0)$.

$$y = -4x - 4$$

22. The equation $y'' + 5y' - 6y = 0$ is called a differential equation because it involves an unknown function y and its derivatives. Find the value(s) of the constant A for which $y = e^{Ax}$ satisfies this equation.

$$A = -6 \text{ and } A = 1$$

23. Evaluate $\lim_{h \rightarrow 0} \frac{\sin^{-1}\left(\frac{\sqrt{3}}{2} + h\right) - \frac{\pi}{3}}{h}$ by interpreting the limit as the derivative of a function at a particular point.

$$\lim_{h \rightarrow 0} \frac{\sin^{-1}\left(\frac{\sqrt{3}}{2} + h\right) - \frac{\pi}{3}}{h} = \frac{d}{dx}(\sin^{-1}(x)) \Big|_{x=\frac{\sqrt{3}}{2}} = \frac{1}{\sqrt{1-x^2}} \Big|_{x=\frac{\sqrt{3}}{2}} = 2$$

24. **Multiple Choice:** Which of the following is the equation of the tangent line to the graph of $f(x) = \tan^{-1}(2x)$ at the point where $x = 0$?

- (a) $y = x$
- (b) $y = x + 1$
- (c) $y = x - 1$
- (d) $y = 2x$

(e) $y = 2x - 1$

D

25. **Multiple Choice:** Consider the curve defined implicitly by $\sin x = e^y$ for $0 < x < \pi$.

What is $\frac{dy}{dx}$ in terms of x ?

(a) $-\tan x$

(b) $-\cot x$

(c) $\cot x$

(d) $\tan x$

(e) $\csc x$

C

26. Consider the following two hyperbolic functions:

Hyperbolic Sine

Hyperbolic Cosine

$$\sinh x = \frac{e^x - e^{-x}}{2}$$

$$\cosh x = \frac{e^x + e^{-x}}{2}$$

(a) Compute $\lim_{x \rightarrow \infty} \sinh x$

$+\infty$

(b) Compute $\lim_{x \rightarrow -\infty} \sinh x$

$-\infty$

(c) Compute $\lim_{x \rightarrow \infty} \cosh x$

$+\infty$

(d) Compute $\lim_{x \rightarrow -\infty} \cosh x$

$+\infty$

(e) Compute the x and y intercepts, if any, for $y = \sinh x$.

The x and y intercept of $y = \sinh x$ is $(0, 0)$.

(f) Compute the x and y intercepts, if any, for $y = \cosh x$.

$y = \cosh x$ has a y -intercept of $(0, 1)$; but, it does not have any x intercepts.

(g) Solve $\sinh x = 1$ for x .

$x = \ln(1 + \sqrt{2})$

(h) Show that $\cosh^2 x - \sinh^2 x = 1$

$$\begin{aligned}\cosh^2 x - \sinh^2 x &= (\cosh x + \sinh x)(\cosh x - \sinh x) \\ &= \left(\frac{e^x + e^{-x}}{2} + \frac{e^x - e^{-x}}{2} \right) \left(\frac{e^x + e^{-x}}{2} - \frac{e^x - e^{-x}}{2} \right) \\ &= (e^x)(e^{-x}) \\ &= 1\end{aligned}$$

(i) Show that $\frac{d}{dx}(\sinh x) = \cosh x$

$$\begin{aligned}\frac{d}{dx}(\sinh x) &= \frac{d}{dx} \left(\frac{e^x - e^{-x}}{2} \right) \\ &= \frac{d}{dx} \left(\frac{1}{2}e^x - \frac{1}{2}e^{-x} \right) \\ &= \frac{1}{2}e^x + \frac{1}{2}e^{-x} \\ &= \frac{e^x + e^{-x}}{2} \\ &= \cosh x\end{aligned}$$

(j) Show that $\frac{d}{dx}(\cosh x) = \sinh x$

$$\begin{aligned}\frac{d}{dx}(\cosh x) &= \frac{d}{dx} \left(\frac{e^x + e^{-x}}{2} \right) \\ &= \frac{d}{dx} \left(\frac{1}{2}e^x + \frac{1}{2}e^{-x} \right) \\ &= \frac{1}{2}e^x - \frac{1}{2}e^{-x} \\ &= \frac{e^x - e^{-x}}{2} \\ &= \sinh x\end{aligned}$$
