Planes

SUGGESTED REFERENCE MATERIAL:

As you work through the problems listed below, you should reference Chapter 11.6 of the recommended textbook (or the equivalent chapter in your alternative textbook/online resource) and your lecture notes.

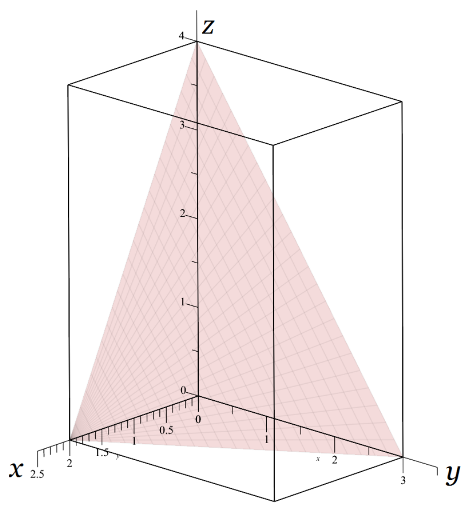
EXPECTED SKILLS:

- Be able to find the equation of a plane that satisfies certain conditions by finding a point on the plane and a vector normal to the plane.
- Know how to find the parametric equations of the line of intersection of two (non-parallel) planes.
- Be able to find the (acute) angle of intersection between two planes.

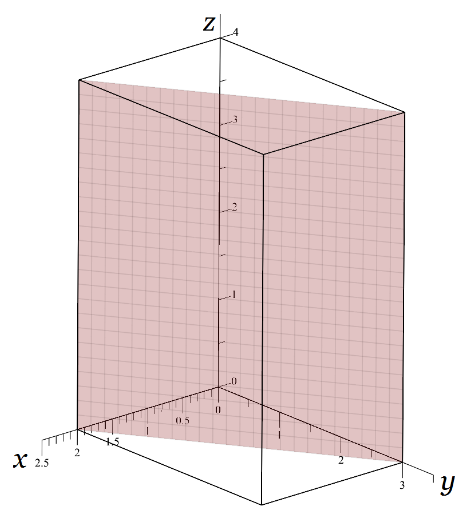
PRACTICE PROBLEMS:

1. For each of the following, find an equation of the plane indicated in the figure.

(a)



(b)



For problems 2-6, determine whether the following are parallel, perpendicular, or neither.

2. Plane $P_1 : 5x - 3y + 4z = -1$ and plane $P_2 : 2x - 2y - 4z = 9$

3. Plane $P_1 : 3x - 2y + z = -3$ and plane $P_2 : 5x + y - 6z = 8$

4. Plane $P_1 : 3x - 2y + z = -3$ and plane $P_2 : -6x + 4y - 2z = 1$

5. Plane $P : 5x - 3y + 4z = -1$ and line $\overrightarrow{\ell}(t) = \langle 2 + 2t, 3 - 2t, 5 - 4t \rangle$

6. Plane $P : 5x - 3y + 4z = -1$ and line $\overrightarrow{\ell}(t) = \left\langle 2 + \frac{5}{2}t, 3 - \frac{3}{2}t, 5 + 2t \right\rangle$

7. Give an example of a plane, P, and a line, L, which are neither parallel nor perpendicular to each other.

For problems 8-13, find an equation of the plane which satisfies the given conditions.

8. The plane which passes through the point $P(1, 2, 3)$ and which has a normal vector of $\mathbf{n} = 4\mathbf{i} - 2\mathbf{j} + 6\mathbf{k}$.

9. The plane which passes through $P(-2, 0, 1)$ and is perpendicular to the line $\overrightarrow{\ell}(t) = \langle 1, 2, 3 \rangle + t\langle 3, -2, 2 \rangle$.

10. The plane which passes through points $A(1, 2, 3)$, $B(2, -1, 5)$ and $C(-1, 3, 3)$.

11. The plane which passes through $A(1, 2, 3)$ and is parallel to the plane $3x - 5y + z = 2$.

12. The plane which passes through $A(-2, 1, 5)$ and is perpendicular to the line of intersection of $P_1 : 3x + 2y - z = 5$ and $P_2 : -y + z = 7$.

13. The plane which contains the point $A(-2, -1, 3)$ and which contains the line $L : x = 1 + t, y = 3 - 2t, z = 4t$.

14. Consider the planes $P_1 : x + y + z = 7$ and $P_2 : 2x + 4z = 6$.

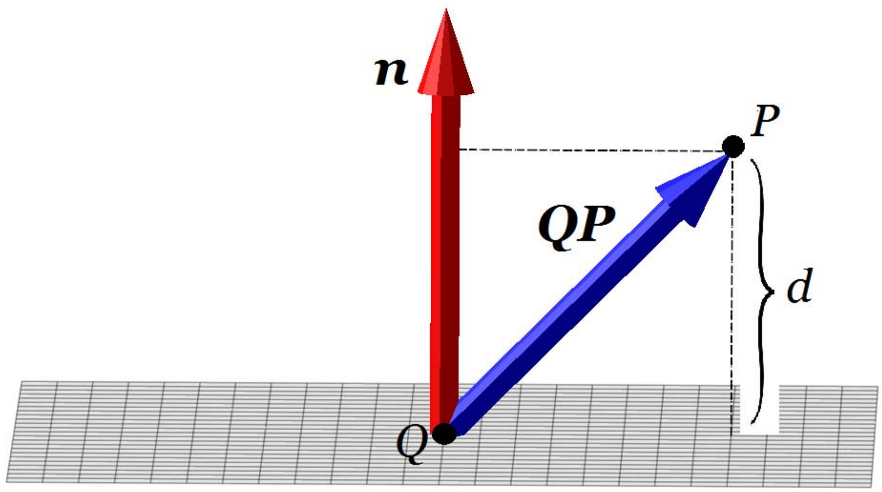
    (a) Compute an equation of the line of intersection of P_1 and P_2.

    (b) Compute an equation of the plane which passes through the point $A(1, 2, 3)$ and contains the line of intersection of P_1 and P_2.

15. Find the acute angle of intersection of $P_1 : 3x - 2y + 5z = 0$ and $P_2 : -x - y + 2z = 3$.

16. Find the acute angle of intersection of $P_1 : 3x - 2y - 5z = 0$ and $P_2 : -x - y + 2z = 3$.

17. Consider the plane which passes through the point Q and whose normal vectors are parallel to $\mathbf{n}$. And, let P be another point in space, as illustrated below.



(a) Show that the distance between the point P and the given plane is $d = \dfrac{|\mathbf{QP} \cdot \mathbf{n}|}{\|\mathbf{n}\|}$.

(b) Use this method to compute the distance between the point $P(2, -1, 4)$ and the plane $x + 2y + 3z = 5$.

18. Consider planes $P_1 : 2x - 4y + 5z = -2$ and $P_2 : x - 2y + \dfrac{5}{2}z = 5$.

(a) Verify that P_1 and P_2 are parallel.

(b) Compute the distance between P_1 and P_2. (Hint: See the previous problem.)
